

---

I have had my Yamaha RX-V681 A/V Receiver for about 2 months now. I was really looking for a receiver that could support anything I throw at it. I was not looking for one that had network capability, until I found out how useful this feature can be! With the help of the Network function on my Yamaha RX-V681 A/V Receiver, we can watch TV or listen to music through compatible devices such as an iPad or iPhone. I also find it very comfortable to be able to browse and stream music from my computer and other devices directly on the home theatre system by using its MusicCast app. Here are some of the features I have on my Yamaha RX-V681 A/V Receiver that I really am enjoying: • Supports Online Services • Airplay Functionality to stream music from a compatible device directly to my home theatre system. I can also use apps such as Spotify and Tidal! • MusicCast App to Airplay, Browse and Stream Music from my iPhone or iPad through the receiver. In addition, I can control the receiver from the app if desired. For example, play a song from Spotify on my iPhone and then switch to Pandora on my TV with one press of a button from the app. This works great when having company or watching TV with friends. • MusicCast App can also be used to remotely control the receiver from my iPhone or iPad! This is a great feature when I want to watch TV and my kids want to browse the web on my iPad. I can put in an order for pizza with an app on my phone and then with one press of a button, the pizza arrives. • AirPlay and Spotify works in iOS and Android devices, so no matter when I am away from home, I will always have access to what I need when I need it! • Internet Radio is another great feature on the receiver. I have listened to 6500+ stations from around the world right in my living room! • Includes HDMI 3D-Ready pass-through • Allows control of Yamaha Home Theater Receiver with Google Home or Amazon Alexa. I can use my voice to change input, adjust volume, mute and more.

My network took only minutes to set up. I just had to follow the steps below: 1. Plug in the network cable into the Ethernet port on the back of my Yamaha RXV681 A/V Receiver, then plug in the other end into any device with an Ethernet port (such as your router) or use a wireless router. 2. Go to the Home menu on the receiver. This is where you can set up your network settings. Select "Network Settings" and then press "Ok." You should see the IP address of the receiver on the screen. 3. Go to the wireless router and look for a device that has an IP address that matches that of your Yamaha RX-V681 A/V Receiver exactly, or use an IP scanner app on your smartphone to find it.
